ABSTRACT

Title: Home in the Age of Amazon

Home in the Age of Amazon explores living in an age where the home as we know it today is nothing but a single component in the larger network of spaces we have come to depend on in our daily lives. In an age dominated by digitization, speedy delivery infrastructure, and user-tailored solutions, we no longer are restricted to the walls of our living units to carry out our daily tasks. Instead, we resort to external spaces just as often as we do our bedrooms, bathrooms, or living rooms, in a manner that has become like second nature. This thesis concludes that a home today is not just a bed, bath, kitchen, etc. but belongs to a new typology: it is a network or cluster, made up of a large set of spaces and programs that include everything the inhabitant does in a day, be it a place to sleep, shop, work, so on. Designing this network requires an understanding of the program not only within a single user's life, but within the lives of those whose daily routines also intersect the program. The home cluster is thus a multi-owned project that must be flexible to suit a multitude of needs. A design methodology is proposed that allows for this complex intersection of programs and users to be broken down and understood, in attempt to automate the site selection, to facilitate design, and to make change and growth possible within this project. The result is an example of a home in the Mtein area of Lebanon, that caters to a group of entrepreneurs, consumers, and employees, by combining all their needed programs while also having the potential for expansion, shifting, and remote presence.

of our Time

2020

/the social dilemma

ent social dilemma

Among other things, this documentary accurately introduces some of the sociological ways we have changed as humans in our physical environment. How can our new lifestyle inform the design of our home?

What can we adopt from Amazon's design approach?

2.

What Is the Home in
the Age of Amazon?

2.1

Behavioral-spatial Shift

An initial look at our behavioral shift can tell a lot about how we interact with our living spaces today. This section explores our lifestyle changes that come as a result

of the era we live in that is dominated by digital platforms and the e-world. The section that follows will elaborate on the particular role Amazon had to play in this lifestyle change.

New spatial boundaries

According to Gibbs and Arnold in their piece "Material Ecologies of Domestic ICT's" our technology has a role in creating new spatial boundaries within our homes. **Devices** are not merely physical objects in the home, they are more like portals that allow us to transport to a digital other-world. Although these other-worlds are physically intangible,

Arnold and Gibbs argue that the way we perceive them is similar to how we experience physical space: some use **technology** as a portal to split between life domains, like splitting between work life and family time, others use it to create introverted nesting spaces for the self, others to create platforms of connecting and socializing.

“

The notion that technologies are usefully understood as forming an 'environment' (rather than being objects that occupy an environment) is a profound one.

”

“

We have identified five logics to ICT-home-spatialities: those that define boundaries between life's domains, those that facilitate surveillance of communications, those that dedicate space to media, those that use technologies to define 'nesting spaces' for self, and those undifferentiated spaces in which communications media are ambient.

”

Technology as a portal to digital space

Digital space as a new type of boundary

“

The 'thingness' of the things that mediate communications is absent, except in so much as they mediate symbolic formats and communicative acts. In this... we explore the physical and spatial aspects of environments of technologies in the ecology of the home.

”

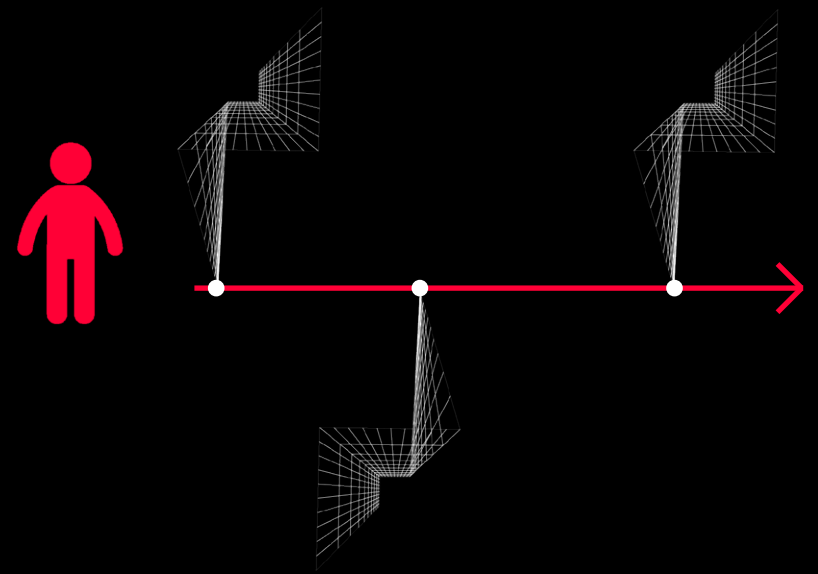

How individual actions/behavior correlate to space

If **technologies** are portals to digital spaces, and the home is an ecology of these digital and physical spaces, then the ecology is determined by the inhabitant's interaction with his/her technological **devices**. Every time an inhabitant or a user of the

home uses a **device**, he/she is actively engaging in creating the home, or in visiting parts of it. Arnold and Gibbs sum this up by saying that the ecology becomes a set of "temporal or sequential arrangements with **information technology**".

“ Spatial arrangements, which are usually implied by the concept of ecology, increasingly are replaced by temporal or sequential arrangements with information technology.”

“

The form of the Collage City can accommodate fragments of utopias without having to accept a singular utopia as a governing model.

”

Source: *Collage Cities*, by Collin Rowe and Fred Koetter

“

In the last decades, the ideology of managing the city form and performance through pre-determined plans has gradually lost its validity. Some contemporary urban planning theories suggest the application of smart design techniques for managing urban complexity... the rule-based design as a smart design technique for a shift from pre-determined urban plans to design rules.

”

“

Several new forms of hybrid and flexible urban approaches have emerged, often grounded over 'soft' relations [15,16] and interactive governance between actors and instruments.

This trend goes hand-in-hand with the emerging ideology of planning without a plan, which eventually points out a generative approach to urbanism [13]. The developing idea of urban complexity, therefore, shifted the mainstream interest in the literature [6,17,18] from the plan to rules.

5.

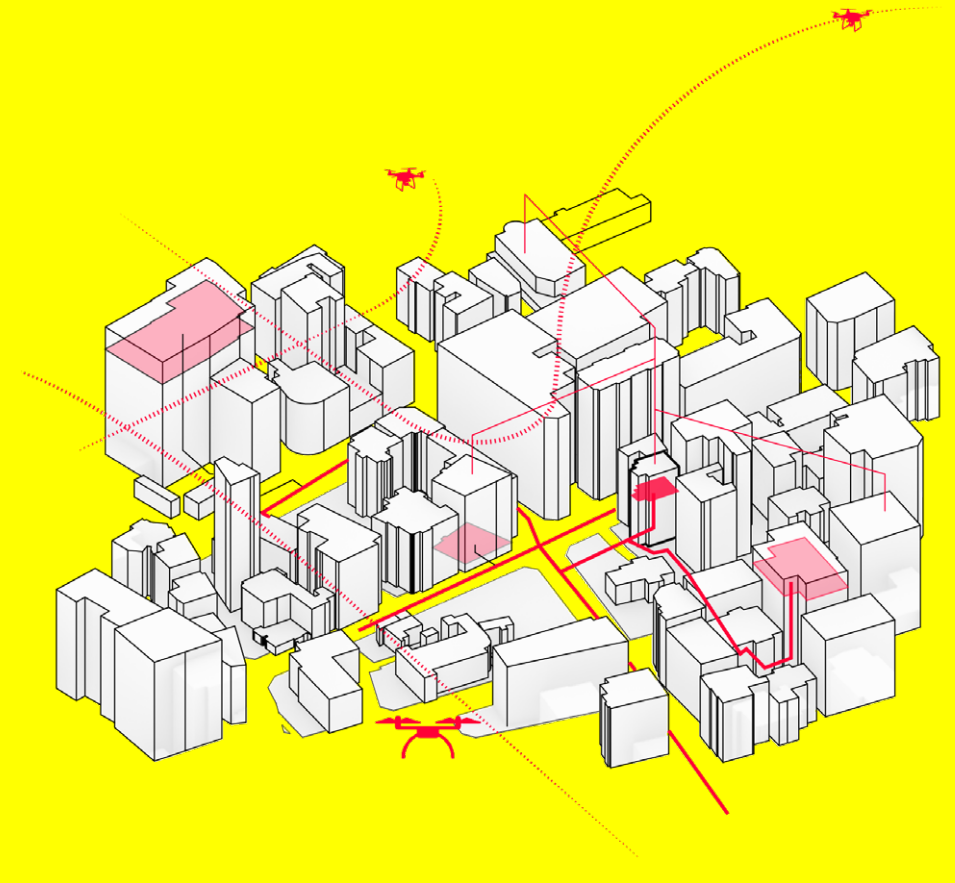

Materializing the
network home

5.1

User group

Since the network home is strongly dependant on the routine of the users who inhabit it, the first step is to select the user group whose living patterns overlap. This allows for the isolation of a network, despite the fact that there will always be more overlaps beyond.

Dana

Dana family

Assistant

Marketing
officer

worker

PR officer

Farmer

Retailer

**Dana:**

- > Young entrepreneur
- > Owns a local organic produce company
- > Struggles include commuting to and from Bekaa
- > Struggles keeping up with essential workers from afar

**Sylve:**

- > Retired lady
- > Looking for company/community life
- > Baking is her hobby
- > Looking for ways to earn a living

**Dana's entourage:**

- > People Dana needs with her at all times
- > Can be family members or business essential services
- > Type of people Dana would stay up late with

5.2

Ownership Model

The network home is place for users with overlapping interests and mutual benefits. It belongs to them all, so its ownership will reflect this logic.

Co-living

One building or apartment
Individual private units within (rooms)
Shared rooms (living space, etc.)

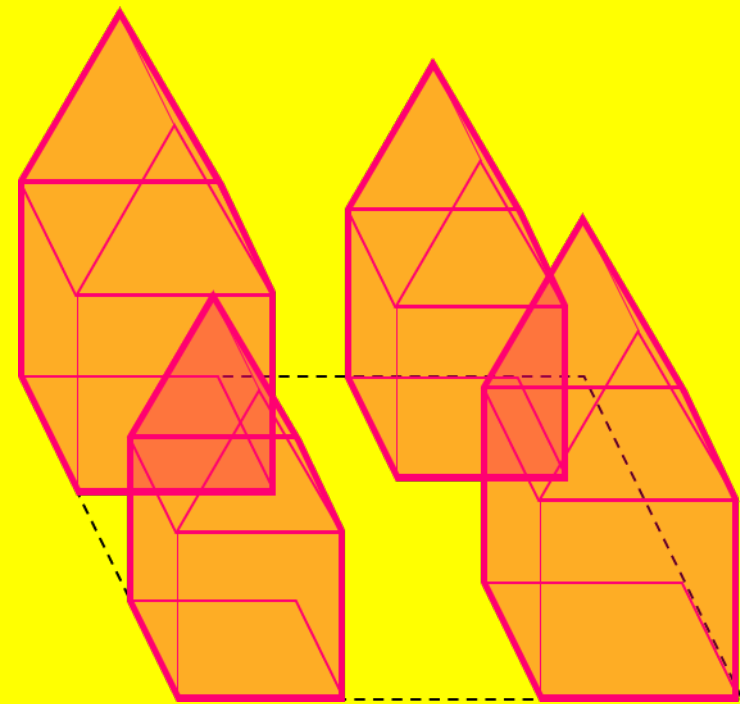

Co-housing

Multiple buildings/ apartments

Shared community spaces, mainly outdoor or outside the living unit (gym, garden, etc.)

Co-op

Any type of ownership unit

Not a housing typology, but an ownership typology. Once built it is more or less permanent.

The Home-Network

Similar to a co-op, but has room for growth, change, admitting new users or letting go of old ones.

5.3

Spacial Configurations

Configuration 1: Concentrated on a base site

Configuration 2: Hybrid

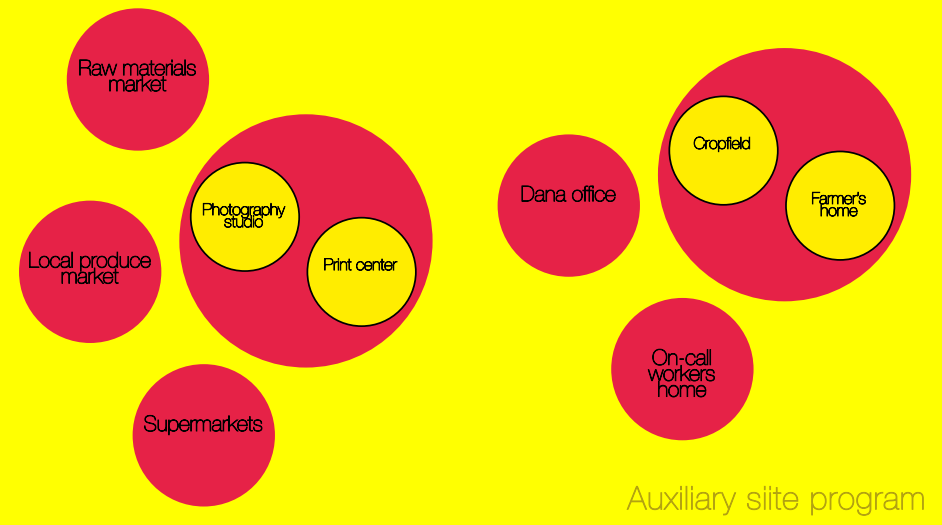

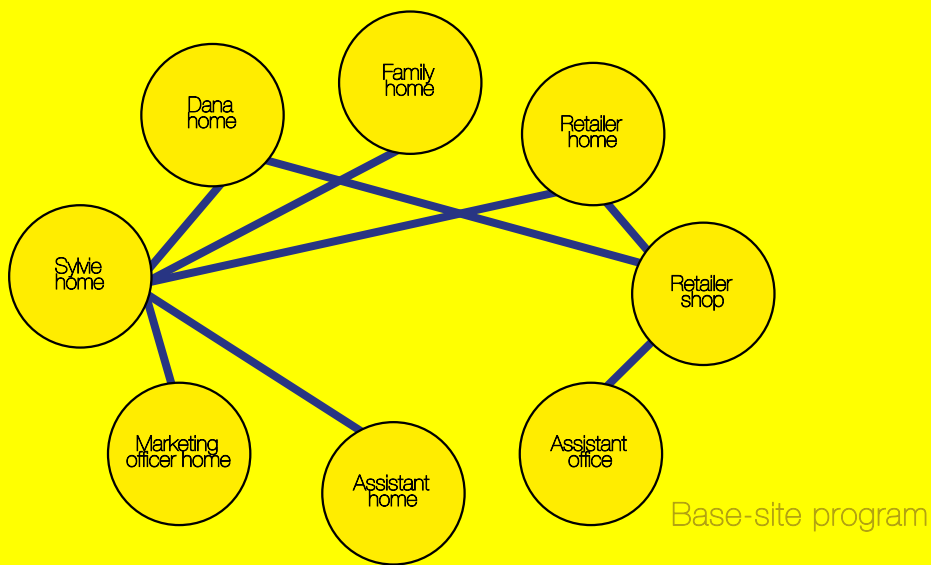

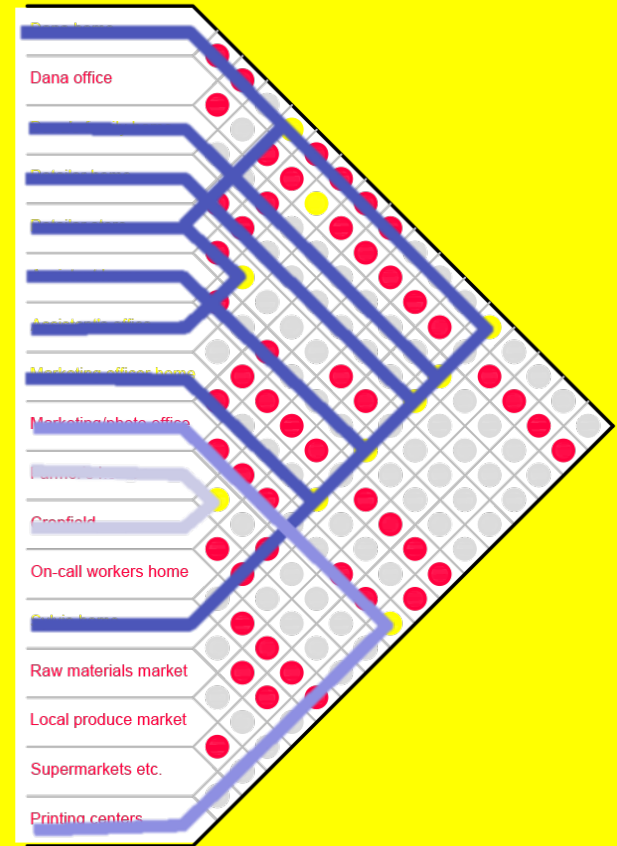

Configuration 3: Dispersed on multiple smaller-scale sites

Building Restrictions

30% exploitable area

11m maximum height

Total building height on site <= 11m

6m distance between buildings if total height > 11m

6m distance between buildings if total height > 11m

Modes of Growth

Starting with existing architecture practices in Mtein, the network home is comprised of a deconstructed Lebanese home that can be built, unit by unit, until the envelope is completed.

The network home is made of simple, cheap, and easily installable materials. Its main structure is a concrete skeleton of columns and slabs, leaving a flexible and open floor plan for future alterations.

Its walls are made of sandwich panels that can be removed and re-installed as necessary.

Its roof is a corrugated sheet used to facilitate vertical expansion as it is lightweight and can be re-installed easily. All materials, once no longer in use, go towards the construction of the auxiliary site units.
